Cosmopolitan in the Extreme Are the Crowded Thoroughfares of the Moroccan Capital-Market Place Especially Is Worth a Visit.

said to be the oldest inhabited city in the world, and Tangier is generally acknowledged to be the second eldest. Tangier lies on the north coast Morocco, facing the straits of Gibraltar, and is about thirty miles from the great fortress. A steamer plies between Gibraltar and Tangier. When the steamer arrives at the Moorish capital, there is a great hubbub. Native boatmen fight and squabble among themselves as to who shall get the most passengers. Being a stranger you would perhaps rather aeroplane with 18 wings. Hope he'r stay on board the steamer than trust yourself to the dusky, howling mob. But there is no other way of getting ashore, and as the view of the town is limited from the deck of the steamer, you find yourself bundled into a corner of the boat and the Moorish boatmen pull for the shore. As soon as you set foot on the landing stage, you are besieged by a crowd of guides. It is in vain you tell them their services are not required, and so in order to get peace you hire the services of a big lanky Arab. You need not follow him where he wants you to go. but as you have provided yourself with a guide book, you make your

tus Are in Use Along the Seaboard of the United States.

Cape May, N. J.-Nestling in the shadow of the life-saving station here is a little frame structure hardly worthy of a second glance, yet once It was the object of interest in a throng which represented the nations of the world. This building was one of the features of the Centennial exposition held in the city of Philadel-Tangier, Morocco.-Damascus is Phla in 1876. At that time the government had just been thoroughly aroused to the necessity of maintaining a great system of guarding our shores with trained life-savers to give systematic assistance to vessels in distress, and in order to demonstrate the character of the work being done in this direction it was decided to make a practical exhibit at the Centennial exposition. A life-saving station of the most approved design. fully manned and equipped, was fitted

out and located on the edge of a lake, which was created for this purpose. and demonstrations of life-saving methods and devices were given there at frequent intervals to throngs of is the aereplane glided to earth, at the spot where persons who had never seen such a

At the close of the great show the life-saving station and its equipment was sent to Cape May, where it did veoman service for many years, but It was eventually displaced by a more commodious structure and improved methods and apparatus. The present equipment of the station is in sharp contrast with that when the Centennial station was the pride of the service. The boats were then light that they might be casily handled. but now they are heavy in order that they may withstand the surf's fury. They were then propelled by oars pulled by sturdy arms, but the boats are now fitted with engines which will drive them through towering waves. And now the boats have holes in the bottoms to let the water out, and such a suggestion a generation ago would have been greeted with roars of ridicule. The crafts of the present time are almost incapable of being sunk. Buffeted by any sea, they will right themselves at once and empty

themselves of water in a few seconds. The old Centennial life-saving station is resting on its old glories. It fulfills no purpose at present. Its roof shelters an old poat or two, which are not likely to be ever called Into active service, and the l never likely to reso activities again

school, and Lieut. Thomas De Witt Milling, one of the army aviators, who acted as pilot. Between the knees of Captain Chandler was strapped a queer-looking object, resembling some-AN ARMY AFROPLANE what a large inverted telescope with a disk-like strachment at the near end. When the aeroplane had reached a height of 600 feet and was skimming along at a speed of fifty niles an hour, suddenly above the roar of the ensine there came to the watchers below a quick ripping sound. At the same instant a score of little lust clouds spurted up from the ground a few hunfred feet away. This was repeated twice. Then he dust had arisen, the officers ran forward to On the ground lay a piece of cheese cloth, three rards by fifteen, punctured with numerous small 10les. And then the secret was out. The curiousooking object carried by the passenger was an teroplane gun and the piece of cheese cloth was the arget at which he had aimed while flying above it almost a mile a minute.

Chandler, commandant of the

structive forces in modern warfare? There

This remarkable meroplane gan is the invention

ARMY OFFICER LEARNING TO FILL three-quarters inches in diameter at the breech and two and seveneighths inches at the muzzle end of the gun. The grooves in the steel jacket have full access to the atmosphere at the breech, thus forming a series of inclosed air ducts running the entire length of the barrel. Each time the gun is

fired the ejector action of the discharge blast sucks through these ducts, from the rear, a draft of air which serves to carry off the heat transmitted to the jacket from the barrel. The cooling is automatic in action, without the use of water or other cooling liquid and without mechanism or moving parts. As inum has six times the heat

which is locatedd near the trigger-

piece at the breech far removed

weight carried. Another novel feature which differentiates the Lewis gun from all other gas-operated guns is the small inclosed operating spring

from all injurious heat effects. The temper of this spring cannot be affected by either direct or transmitted heat, no matter of rapid and long-continued firing. The development tests of the gun, which have been in progress for two years, show that the barrel does not become everheated under continuous fire at full speed, and that it will not therefore be necessary to carry along an extrabarrel when on the firing line. Since no cooling water is necessary, and no special mount except a small stake or "cowboy" mount weighing about

eight pounds, the field equipment of the Lewis cun is reduced to a minimum. The gun may be fired from any natural support found in the field. such as a rock, log stump, tree or mount of earth. It is even possible to empty a manazine while helding the gun to the shoulder or from the hip, as the recall effect is scarcely noticeable. It is a matter of note that one of the most

conspicuous things on the battlefield in South Africa was the jet of steam from the boiling water which was being used on the barrels of the rapid fire guns for cooling purposes.

The gain is standicity Itself. It has only fortyseven parts, as compared with twice that number for other rapid fire gans. On the battlefield or in the air where tools are necessarily scarce and where they are needed more than anywhere else when they are wanted, the Lewis gun would certabily cause no worry, should some piece of the mechanism be broken or otherwise get out of working order, since the only tool required to dissemble or assemble the gun is the point of a

The sustained rapidity of fire of which the gun is capable makes it a far more dangerous and effective weapon than any bomb-dropping device

The accuracy of the firing of the Lewis aeroplane gun on its first test was not only surprising in itself, but has aroused attention on the part of our army and navy experts to the fact that our battleships and the disappearing gun batteries of our coast defenses are completely unprepared for attack from the air. In the opinion of many, including Colonel Lewis, who is also the inventor of the Lewis depression position finder now employed in the coast artillery service it marks the beginning of a development that is destined to produce radical changes in our land deferse and coast armaments, both for offense and defense

According to Colonel Lewis, an aeronlane costing not more than \$5,000 will easily be able to carry the gun, 2,000 rounds of animumitten, the run courage and the pilot. At a locality of one mile or or air r, and while movies of a closed of of this point is a bolt steel tob. Those and the stand fire a pixel north of battleships, and the common a stand

Not Averse to Stretching Conscience by Adding or Deducting a Few Pounds When They Want to Know Their Weight.

"See that scale out there," said the butcher, laying down his knife and jerking his finger toward a large scale that was standing outside the butcher shop. "Well, I suppose you have the same idea that most of my other customers have. They think I keep it there to weigh meat on. I don't. I will let you into a secret and tell you why I placed the scale there. It is to weigh my customers on.

"You would be surprised if you knew how many of my customers desired to be weighed. Most of them are women and they always bother me at my busiest time, which is Saturday. They think when they come in here and buy a pound of steak or chops that in return for their custom I ought to lay down my work and go outside and weigh them.

"Every one knows how sensitive a woman is about her weight. If you tell a woman that she is gaining weight you might as well tell her not come around and deal with you any more. They worry a great deal about it. I find that it pays to be dicreet when you are weighing a woman. You can judge from their conversation how much they think they weigh, and never shock a woman by telling her she
